

CRM Restructuring & Tier Management System

Project Requirements Document

Version

v1.0

Priority

High

Deadline

ASAP

1. Project Overview

The purpose of this update is to restructure the CRM workflow and customer management process.

The current CRM relies heavily on Team Leaders and partially on automated assignment systems. The new workflow will centralize lead management under Data Analysts, improve lead visibility, simplify customer tracking, and introduce a manual Tier Management System.

Automation improvements are **NOT** part of this phase.

2. Scope of Work

The following modules must be modified:

1. Lead Assignment
 2. Customer View
 3. Notes Management
 4. Tier Management
 5. Rejected Customer Management
 6. Permissions & Access Control
 7. Filtering & Search
-

3. Lead Assignment Restructure

Current Workflow

Sales Manager
↓
Team Leader
↓
Agent

New Workflow

Data Analyst
↓
Agent

Requirements

Remove Sales Manager Role

- Remove Sales Manager dependency from Lead Assignment.
- Replace all relevant references with Data Analyst.

Team Leader Assignment Removal

Current:

- Team Leaders assign leads to agents.

New:

- Team Leaders will no longer assign leads.
- Data Analysts will assign leads directly to agents.

Data Analyst Responsibilities

Data Analysts must be able to:

- View all leads
 - Assign leads
 - Reassign leads
 - Monitor assigned leads
-

4. Lead Assignment Visibility

Inside Lead Assignment display:

- Data Analyst
- Team Leader
- Assigned Agent

This information must be visible from the Lead Assignment screen without requiring additional navigation.

5. Rejected Customer Recovery

Current Situation

Rejected customer database contains a large number of customers.

Required Change

Provide functionality to:

- Move rejected customers back into active customer pool.
- Make them eligible for lead assignment again.

Migration Requirement

Existing rejected customers should be migrated into the normal customer pool.

Implementation can be:

- Bulk migration script
- Admin action
- Background migration process

Developer may choose the most efficient method.

6. Lead Assignment Filtering Improvements

Existing Issue

Only basic search functionality exists.

Required

Add Date Range Filtering.

Fields

- Start Date
- End Date

Example

Show all leads assigned between:

2026-06-01 → 2026-06-10

The filter should work alongside existing search functionality.

7. Customer View Page Improvements

Existing Layout

Current sections include:

- Product Information
- Customer Information
- CRM Information
- Order History
- Shipping Information
- Courier Notes
- Rider Instructions
- Logs

Rider Instructions

No new work required.

Can remain untouched unless modification is extremely simple.

8. Customer Notes System

Existing Problem

Important customer history is hidden inside Activity Logs.

Users must open logs to understand customer context.

This slows down workflow.

Required Solution

Create a dedicated Customer Notes Section.

Location

- Under Customer Information
- Beside Customer Information

Developer may choose the most user-friendly placement.

Customer Notes Display

Show important notes such as:

- Customer does not answer calls
- Customer requested callback
- Delivery completed
- Customer requested change
- Courier remarks
- Internal operational notes

The purpose is to provide a quick customer overview without opening logs.

Automatic Population

When new notes are added through the CRM:

- They should automatically appear in Customer Notes.

The Notes section should act as a summarized customer history area.

9. Notes Permission System

Agent Permissions

Agents can:

- Create Notes
- View Notes

Agents cannot:

- Edit Notes
 - Delete Notes
-

Data Analyst Permissions

Data Analysts can:

- Create Notes
- View Notes
- Edit Notes
- Delete Notes

Data Analysts act as moderators of customer notes.

10. Automation System

Current automation system is not part of this phase.

Requirements

No automation redesign required.

Continue using manual assignment.

Future automation work will be handled separately.

11. Manual Lead Distribution Workflow

```
graph TD; A[New Lead] --> B[Data Analyst]; B --> C[Agent Assignment]; C --> D[Agent Processing]
```

Data Analyst becomes the central control point.

12. Tier Management System

Purpose

Replace purchase-count-based customer value assumptions with manual business-driven segmentation.

Tier Structure

Create six tiers:

- Tier 1
 - Tier 2
 - Tier 3
 - Tier 4
 - Tier 5
 - Tier 6
-

Tier Definitions

Tier 1

Highest Value Customers

Examples:

- High repeat potential
 - High order value
 - Strong engagement
-

Tier 6

Highest Risk Customers

Examples:

- Frequent cancellations
 - Poor delivery success
 - Low trust score
-

Assignment Method

Tier assignment is manual.

Data Analysts evaluate customers and assign tiers.

No automation required.

13. Tier Assignment Location

Inside Customer Profile:

Add Tier Management section.

Data Analyst should be able to:

- View current tier
- Change tier
- Save tier changes

14. Rejected Customer Restriction

Only Tier 6 customers may be moved into:

- Rejected List

Validation Rule

```
IF Customer Tier != Tier 6
```

```
THEN
```

```
Reject Action = Disabled
```

15. Future Considerations (Not Part of Current Scope)

The following are NOT included:

- Automatic lead assignment
- AI-based customer scoring
- Automated tier calculation
- Fraud detection redesign
- Courier tracking redesign
- Activity log redesign

These may be implemented in future phases.

16. Deliverables

The implementation should include:

- Database changes
- API updates

- UI updates
 - Permission updates
 - Migration support
 - Validation rules
-

17. Acceptance Criteria

The project is considered complete when:

- ☐ Data Analyst fully replaces Sales Manager workflow
 - ☐ Team Leaders no longer assign leads
 - ☐ Date Range Filtering works
 - ☐ Rejected customers can be restored
 - ☐ Customer Notes section exists
 - ☐ Data Analysts can edit/delete notes
 - ☐ Agents cannot edit/delete notes
 - ☐ Tier 1–Tier 6 system exists
 - ☐ Only Tier 6 customers can be rejected
 - ☐ Manual lead assignment workflow is operational
 - ☐ No existing CRM functionality is broken
-

18. Pre-Implementation Requirement

Before writing code:

1. Generate complete system flowchart.
 2. Generate ERD (Entity Relationship Diagram).
 3. Propose database changes.
 4. Identify potential breaking changes.
 5. Wait for approval before implementation.
-
